

Twenty-Seven Years Bring no Deaths from Vitamins but Three Million from Pharmaceuticals

By Anthony Gucciardi, NUTRA Ingredients

Despite mainstream medical establishments and media outlets portraying multivitamin supplements as worthless and oftentimes toxic, vitamins have led to 0 deaths over the past 27 years. In contrast, pharmaceutical drugs were responsible for 3 million deaths, topping the death toll from traffic-related incidents. In 2009, pharmaceuticals were responsible for the death of 37,485 people nationwide.

The statistics come from the Annual Report of the American Association of Poison Control Centers' National Poison Data System (NPDS), and the findings go against the claims of most mainstream doctors and medical officials, who claim that pharmaceutical drugs are the only 'science-backed' method to 'treating' illness. However, the report highlights the fact that pharmaceuticals oftentimes lead to death and countless other side effects. In fact, the number of hospitalizations and side effects were not documented by the report. While the report only detailed the 3 million deaths as a result of drug use, countless other adverse health effects have been linked to popular pharmaceuticals such as cold and allergy medications.

Shockingly, the average drug label contains around 70 negative side effects, though many popular brand name drugs have been found to contain 100 to 125. Some drugs even list around 525 negative effects on the label. These drugs are being prescribed by doctors to 'treat' patients, when the drug side effects are routinely worse than the very illness they claim to treat.

These side effects are one reason that the FDA is now pulling over 500 cold and allergy drugs off of pharmacy store shelves. What the FDA is not addressing, however, are the negative effects associated with the top-selling therapeutic class pharmaceutical drug -- antipsychotics. Drugs, which are prescribed to 'treat' suicidal thoughts and behavior, have been found to actually lead to suicide and other diseases such as diabetes. The side effects were so significant that even U.S. pediatric health advisers have begun speaking out to the media, citing the link between antipsychotics and diabetes.

Previous whistleblowers exposed the link between mental health drugs and suicide after it was covered up by the makers of the drugs. Eli Lilly & Co, the makers of Prozac, ignored and hid studies as far back as the 1980s that found Prozac led to suicidal thoughts. Until Harvard Physicist Martin Teicher leaked the findings to the press, the company managed to hide the news from consumers worldwide.

Teicher said that the American people were being "treated like guinea pigs in a massive pharmaceutical experiment."

Pharmaceutical drugs are loaded with toxic side effects and do not eliminate the root cause of disease they claim to treat. Killing 3 million within the last 27 years, and topping traffic fatalities each year, pharmaceutical drugs are a deadly and ineffective option when it comes to combating disease.
